

Python Revision Notes (Practice Class)

Concept	One Line Explanation	Example Practiced
True / False	Boolean values used in conditions and comparisons.	5 == 5 → True
=	Assignment operator used to store value in variable.	a = 5
==	Comparison operator used to check equality.	a == b
Case Sensitive	Python string comparison checks uppercase/lowercase.	'Apple' == 'apple' → False
.upper()	Converts string into uppercase.	'APPLE' == 'apple'.upper() → True
.lower()	Converts string into lowercase.	'apple' == 'APPLE'.lower() → True
.title()	Converts first letter of each word to capital.	'Apple' == 'apple'.title() → True
: (Colon)	Used after if, while, for and def statements.	while n <= 10:
pass	Used when block is empty temporarily.	if True: pass
print()	Used to display output on screen.	print('2 x 1 = 2')
Data Types	Common data types are str, int and float.	str, int, float
while loop	Repeats code until condition becomes False.	while n <= 10:
<=	Less than or equal to operator.	while n <= 10
n += 1	Shortcut for increasing value by 1.	n += 1
import time	Imports complete time module.	import time
time.sleep(1)	Pauses program for 1 second.	time.sleep(1)
from time import *	Imports all functions from time module.	sleep(1)

Practice Code:

```
from time import *  
  
n = 1  
  
while n <= 10:  
    print('2 x ', n, ' = ', 2*n)  
    sleep(1)  
    n += 1
```
